## **Portalis™ Completes Successful Lab Demonstration of Workstation Integrator Technology**

### ***Patented Technology for Monitoring and Controlling Multiple Systems From Single Workstation Now Moves Beyond Conceptual Stage to Working Prototype***

**MIDVALE, Utah — Oct. 13, 2009** — Portalis™, a developer of state-of-the-art control room integration solutions, today announced that the company has completed a successful lab demonstration of its flagship product, the Portalis Workstation Integrator. Announced to the public in June, the Workstation Integrator is the first electronic appliance to enable operators to monitor and control up to eight different computers and control systems from a single integrated workstation. This enhances the performance and strategic decision-making of personnel in control rooms and operations centers.

The patented Workstation Integrator is designed for control room operators and systems integrators in a broad range of applications, such as broadcasting, military and civilian command and control, and industrial process control. In the lab, Portalis's lead engineers and programmers staged a strikingly successful demonstration of the prototype hardware, gateway, and software. The demonstration confirmed all of the system's technologies and sub-technologies including scaling, saving and recalling layouts, creating sub-windows, and shifting the focus of control. In addition, engineers were able to process, display, and control video from multiple computer systems through the various Workstation Integrator PCBs and out to a separate, single, and independent workstation.

“Successful completion of the lab demonstration is a significant milestone for our company,” said Dean Malmstrom, product designer and CTO of Portalis. “We have proved that the technology works, and we’ve demonstrated that all components can meet the product objectives that were set by our outstanding development team. Most importantly, we validated that we

*More...*

have the 'secret sauce' – the video processing core that makes the Workstation Integrator unique. We're confident that the system will meet all customer expectations.”

The Workstation Integrator improves operators' decision-making abilities by changing the dynamic by which they interact with multiple computers and control systems. Using novel image processing techniques, the system places all of the information vital to decision-making directly in front of operators, enabling them to make more accurate, competent, and timely judgments without being confused or sidetracked with nonessential input. The Workstation Integrator combines visual information from various stand-alone systems onto a single workstation display without requiring engineers to install new drivers or software, or to redesign or change each independent system. The Workstation Integrator also provides shared control to multiple managers and operators, giving them the unprecedented ability to simultaneously view the same set of systems, create unique information layouts, and share control of specific systems.

Following the successful lab demonstration, Portalis is focused on making the prototype available for customer trials. “In the weeks and months ahead, we're confident that thousands of customers, in multiple industries around the world, will recognize how the Workstation Integrator can add significant strategic and operational value to their organizations, and will be seeking lab demonstrations and on-site trials to experience the technology first-hand,” said Dan Bastian, president and CEO of Portalis. “This is a very exciting time for the industries that will use this technology because they will be able to move forward with a solid product that has been demonstrated to be technically sound and unmatched.”

#### **About Portalis**

Portalis specializes in the design and development of advanced control room integration solutions. Any organization that demands effective control room operations can exploit the patented Workstation Integrator, including broadcasters, military and civilian command and control, and industrial process control. The Workstation Integrator improves operators' decision-making ability by changing the dynamic by which they interact with multiple computers and control systems. Operators make more effective decisions by simultaneously monitoring and controlling up to eight different systems from a single workstation.
